

Twitter Client

In this project, you guys are going to build a simple Twitter client. Nothing super-fancy, just log in and display your feed.

API documentation is at <https://dev.twitter.com/rest/public>. You'll want to start off pulling the feed from the user's home timeline using this API:

https://dev.twitter.com/rest/reference/get/statuses/home_timeline. Of course, in order to log in you'll need to learn a bit about OAuth.

The simplest way to do OAuth is probably the library at <https://github.com/fernandezpablo85/scribe-java>. Check it out, or feel free to explore alternate solutions.

For the actual API calls, we're partial to the [Retrofit](#) library for web services.

You'll need to create an app on Twitter and obtain an API key to make any requests to the API; you can do that at <https://apps.twitter.com/> (make sure you're logged into a Twitter account when you visit)
