

Contact Browser

Implement a browser for the contacts on the device

Display list of contacts, each row should display the contact's name and phone number. Only contacts with phone number should be displayed. It's up to you on how to handle/display people who has multiple phone numbers.

Clicking on a contact should bring the user to the dialer app with the phone number prefilled.

Implement a search functionality in the action bar such that the contacts are filtered in realtime as the user types in the search query. A contact will pass the filter if any part of the contact's name or number matches the query.
